PO-k-ternary ideal, Full PO-k-ternary ideal, Additive idempotent, Additive regular.

## ABSTRACT

In this paper we introduce the notion of PO- $k$-ternary ideals, full PO- $k$-ternary ideal and characterize PO- $k$-ternary ideals. We will prove some results about these PO- $k$-ternary ideals and full PO-k-ternary ideal.

## INTRODUCTION

The notion of semiring was introduced by Vandiver, (1934) in 1934. In fact semiring is a generalization of ring. In 1971 Lister, (1971) characterized those additive subgroups of rings which are closed under the triple ring product and he called this algebraic system a ternary ring. MadusudhanaRao, Siva Prasad and Srinivasa Rao, (2015), studied and investigated some results on partially ordered ternary semiring.

## Preliminaries

Definition 2.1[ 6] : A nonempty set T together with a binary operation called addition and a ternary multiplication denoted by [ ] is said to be a ternary semiring if T is an additive commutative semigroup satisfying the following conditions :
i) $[[a b c] d e]=[a[b c d] e]=[a b[c d e]]$,
ii) $[(a+b) c d]=[a c d]+[b c d]$,
iii) $[a(b+c) d]=[a b d]+[a c d]$,
iv) $[a b(c+d)]=[a b c]+[a b d]$ for all $a ; b ; c ; d ; e \in \mathrm{~T}$.

[^0]Note 2.2[6]: For the convenience we write $x_{1} x_{2} x_{3}$ instead of $\left[x_{1} x_{2} x_{3}\right]$
Note 2.3[6]: Let Tbe a ternary semiring. If $A, B$ and $C$ are three subsets of $T$, we shall denote the set $A B C=$ $\{\Sigma a b c: a \in A, b \in B, c \in C\}$.
Note 2.4[6]: Let $T$ be a ternary semiring. If $A, B$ are two subsets of T , we shall denote the set $\mathrm{A}+\mathrm{B}=\{a+b: a \in A, b \in B\}$ and $2 \mathrm{~A}=\{a+a: a \in \mathrm{~A}\}$.
Note 2.5[6]: Any semiring can be reduced to a ternary semiring.

Definition 2.6 [6]: A ternary semiring T is said to be a partially ordered ternary semiring or simply PO Ternary SemiringorOrdered Ternary Semiringprovided T is partially ordered set such that $a \leq b$ then
(1) $a+c \leq b+c$ and $c+a \leq c+b$,
(2) $a c d \leq b c d, c a d \leq c b d$ and $c d a \leq c d b$ for all $a, b, c, d \in \mathrm{~T}$.

Throughout Twill denote as PO-ternary semiring unless otherwise stated.

Theorem 2.7[6]: Let Tbe a po-ternary semiring and $\mathrm{A} \subseteq \mathrm{T}$, B $\subseteq \mathrm{T}$ and $\mathrm{C} \subseteq \mathrm{T}$. Then (i) $\mathrm{A} \subseteq(\mathrm{A}]$, (ii) $((\mathrm{A}]]=(\mathrm{A}]$, (iii)
(A] B$](\mathrm{C}] \subseteq$ ( ABC$]$ and (iv) $\mathrm{A} \subseteq \mathrm{B} \Rightarrow \mathrm{A} \subseteq$ ( B$]$ and (v) $\mathrm{A} \subseteq \mathrm{B}$ $\Rightarrow(\mathrm{A}] \subseteq(\mathrm{B}]$, (vi) $(\mathrm{A} \cap \mathrm{B}]=(\mathrm{A}] \cap(\mathrm{B}]$, (vii) $(\mathrm{A} \cup \mathrm{B}]=(\mathrm{A}] \cup$ (B].

Definition 2.8 [6]: A nonempty subset A of a PO-ternary semiring T is a $P O$-ternary ideal of T provided A is additive subsemi group of $\mathrm{T}, \mathrm{ATT} \subseteq \mathrm{A}, \mathrm{TTA} \subseteq \mathrm{A}, \mathrm{TAT} \subseteq \mathrm{A}$ and A$]$ $\subseteq \mathrm{A}$.

Theorem 2.9[8] : Let T be a PO-ternary semiring and A, B be two PO-ternary ideals of T, then the sum of $\mathrm{A}, \mathrm{B}$ denoted by A +B is a PO-ternary ideal of T where $\mathrm{A}+\mathrm{B}=\{x=a+b / a \in$ $\mathrm{A}, b \in \mathrm{~B}\}$.

## PO-k-Ternary Ideals

In this section we will study a more restricted class of POternary ideals in a PO-ternary semi ring, which is called PO-kternary ideals or subtractive, and we introduce some related results and examples.

Definition3.1: A PO-ternary ideal A of a PO-ternary semi ring T is said to be $P O$-k-ternary ideal or subtractive provided for any two elements $a \in \mathrm{~A}$ and $x \in \mathrm{~T}$ such that $a+x \in \mathrm{~A} \Rightarrow x \in \mathrm{~A}$.

Example 3.2: In any PO-ternary semi ring of the set of real numbers R, every ideal A is PO- $k$-ternary ideal, since for any $a \in \mathrm{~A}, \in \mathrm{~T}$ such that $a+x \in \mathrm{~A}$ then $a+x+(-a) \in \mathrm{A}$, so $x \in \mathrm{~A}$.

Example 3.3: In the semi ring $\mathrm{Z}^{+}$under the operations max and min, the set $\mathrm{I}_{\mathrm{n}}=\{1,2,3, \ldots, \mathrm{n}\}$ is a PO-ternary k-ideal of $\mathrm{Z}^{+}$. Since for any element $a \in \mathrm{I}_{\mathrm{n}}$ and $x \in \mathrm{Z}^{+}$such that $a+x=\max$ $\{a, x\} \in \mathrm{I}_{\mathrm{n}}$, implies $x \in \mathrm{I}_{\mathrm{n}}$.

Example3.4: Consider the PO-ternary semi ring $Z_{0}^{-}$under the usual addition, ternary multiplication and natural ordering $\leq$, let $\mathrm{A}=\{-3 \mathrm{k} / k \in \mathrm{~N} \cup\{0\}\}$. Then A is a PO-k-ternary ideal of $Z_{0}^{-}$.

Definition3.5: Let $n, i$ being integers such that $2 \leq n, 0 \leq i<n$, and $\mathrm{B}(n, i)=\{0,1,2,3, \ldots \ldots, n-1\}$. We define addition and ternary multiplication in $\mathrm{B}(n, i)$ by the following equations.

$$
\begin{gathered}
x+y= \begin{cases}x+y & \text { if } x+y \leq n-1 \\
l & \text { if } x+y \geq n \\
\text { where } l \equiv(x+y) \bmod m, m=n-i \\
i \leq l \leq n-1\end{cases} \\
{[x y z]= \begin{cases}x y z & \text { if } x y z \leq n-1 \\
l & \text { if } x y z \geq n \\
\text { where } l \equiv(x+y) \bmod m, m=n-i \\
i \leq l \leq n-1\end{cases} }
\end{gathered}
$$

Note3.6: The set $\mathrm{B}(n, i)$ is a commutative PO-ternary semi ring under addition, ternary multiplication [ ] as defined in definition 5.1.5, and natural ordering.

| 8 | 0 | 8 | 7 | 9 | 8 | 8 | 9 | 8 | 7 | 9 |
| 9 | 0 | 9 | 9 | 9 | 9 | 9 | 9 | 9 | 9 | 9 |

Example 3.7: The $B(5,2)=\{0,1,2,3,4\}$ is a commutative PO-ternary semi ring such that $0 \leq 1 \leq 2 \leq \leq 3 \leq 4$ and the operations defined as follows:

| + | 0 | 1 | 2 | 3 | 4 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 1 | 2 | 3 | 4 |
| 1 | 1 | 2 | 3 | 4 | 2 |
| 2 | 2 | 3 | 4 | 2 | 3 |
| 3 | 3 | 4 | 2 | 3 | 4 |
| 4 | 4 | 2 | 3 | 4 | 2 |

| [] | 0 | 1 | 2 | 3 | 4 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | 0 | 0 | 0 | 0 | 0 |
| 1 | 0 | 1 | 2 | 3 | 4 |
| 2 | 0 | 2 | 4 | 3 | 2 |
| 3 | 0 | 3 | 3 | 3 | 3 |
| 4 | 0 | 4 | 2 | 3 | 4 |

Then $\mathrm{I}_{1}=\{0,3\}$ is a PO-k-ternary ideal of $\mathrm{B}(5,2)$. But $\mathrm{I}_{2}=$ $\{0,2,3,4\}$ is a PO-ternary ideal, but $\mathrm{I}_{2}$ is not PO- $k$-ternary ideal. Since $2 \in I_{2}, 2+1 \in I_{2}$, but $1 \notin I_{2}$.

Theorem 3.8: In a PO-ternary semi ring $T$, the set of zeroed $Z$ ( T ) is a PO-ternary ideal of T .

Proof: Let $a, b \in \mathrm{Z}(\mathrm{T})$, then there exist $x \in \mathrm{~T}$ such that $a+x=$ $x+a=x$ and $b+x=x+b=x$. Now $(a+b)+x=a+(b+x)$ $=a+x=x \Rightarrow a+b \in \mathrm{Z}(\mathrm{T})$. Now let $s, t \in \mathrm{~T}$. Then $\operatorname{stx}=\operatorname{st}(a+$ $x)=s t a+s t x \Rightarrow s t a \in \mathrm{Z}(\mathrm{T})$, sxt $=s(a+x) t=s a t+s x t \Rightarrow s a t \in \mathrm{Z}$ $(\mathrm{T})$ and $x s t=(a+x) s t=a s t+x s t \Rightarrow a s t \in \mathrm{Z}(\mathrm{T})$.

Therefore $\mathrm{Z}(\mathrm{T})$ is a ternary ideal of T .
Suppose that $a \in \mathrm{Z}(\mathrm{T}), x \in \mathrm{~T}$ such that $x \leq a . \quad x \leq a \Rightarrow x+a \leq a+$ $a \Rightarrow x+a \leq a \Rightarrow x+a=a$. Therefore $x \in \mathrm{Z}(\mathrm{T})$. Hence $\mathrm{Z}(\mathrm{T})$ is a PO-ternary ideal of T.

Theorem3.9: In a PO-ternary semiring $T$, the set of zeroed $Z$

Example3.6: In note 5.1.6, $n=10, i=7$, then we have B $(10,7) \neq \mathrm{T})$ is PO- $k$-ternary ideal of T.
$\{0,1,2,3,4,5,6,7,8,9\}$ and natural ordering, the operations
defined as follows:
Proof: By theorem 3.8, Z (T) is a PO-ternary ideal of T. To show that $\mathrm{Z}(\mathrm{T})$ is a PO-k-ternary ideal of T , let $t \in \mathrm{~T}$ and $a \in \mathrm{Z}$
(T) such that $a+t \in \mathrm{Z}(\mathrm{T})$, therefore there exist $x \in \mathrm{~T}$ such that $a+t+x=x$. But $a+y=y$ for some $y \in \mathrm{~T}$. Then we have $x+y=a+t+x+a+y=t+(a+y+a+x)=t$ $+(y+a+x)=t+(y+x)=t+(x+y)$. Therefore $t \in \mathrm{Z}(\mathrm{T})$ and hence $\mathrm{Z}(\mathrm{T})$ of T is PO-k-ternary ideal of T .

Theorem 3.10: Let $T$ be a PO-ternary semiring and $I$ be a left PO-ternary ideal of T and A, B be a non-empty subsets of T, Then $(\mathrm{I}: \mathrm{A}, \mathrm{B})=\{r \in \mathrm{~T}: r a b \in \mathrm{I}$, for all $a \in \mathrm{~A}, b \in \mathrm{~B}\}$ is a left PO-ternary ideal of $T$.

Proof: Let $x, y \in(\mathrm{I}: \mathrm{A}, \mathrm{B})$. Then $x a b, y a b \in \mathrm{I}$ for all $a \in \mathrm{~A}$ and $b \in \mathrm{~B}$. Then $x a b=s, y a b=t$ for some $s, t \in \mathrm{I}$. Then $s+t=x a b$ $+y a b=(x+y) a b \in \mathrm{I} \Rightarrow(x+y) \in(\mathrm{I}: \mathrm{A}, \mathrm{B})$. Let $p, q \in \mathrm{~T}$ and $x \in$ (I : A, B). $x \in(\mathrm{I}: \mathrm{A}, \mathrm{B}) \Rightarrow x a b \in \mathrm{I}$. Since I is a left PO-ternary ideal of T. Hence $p q(x a b) \in \mathrm{I} \Rightarrow(p q x) a b \in \mathrm{I} \Rightarrow p q x \in(\mathrm{I}: \mathrm{A}, \mathrm{B})$. Now, suppose that $p \in \mathrm{~T}$ and $x \in(\mathrm{I}: \mathrm{A}, \mathrm{B})$ such that $p \leq x . x \in$ $(\mathrm{I}: \mathrm{A}, \mathrm{B}) \Rightarrow x a b \in \mathrm{I} . p \leq x \Rightarrow p a b \leq x a b . p a b \leq x a b, \mathrm{I}$ is a left PO-ternary ideal of T and hence $p a b \in \mathrm{I} \Rightarrow p \in$ (I : A, B). Therefore $p \in \mathrm{~T}$ and $x \in(\mathrm{I}: \mathrm{A}, \mathrm{B})$ such that $p \leq x \Rightarrow p \in(\mathrm{I}: \mathrm{A}$, B). Hence (I : A, B) is a left PO-ternary ideal of T.

Theorem 3.11: Let $T$ be a PO-ternary semiring and $I$ be a lateral PO-ternary ideal of T and $\mathrm{A}, \mathrm{B}$ be a non-empty subset of T , Then ( $\mathrm{I}: \mathrm{A}, \mathrm{B})=\{r \in \mathrm{~T}: \operatorname{arb} \mathrm{I}$, for all $a \in \mathrm{~A}, b \in \mathrm{~B}\}$ is a lateral PO-ternary ideal of T.

Proof: Let $x, y \in(\mathrm{I}: \mathrm{A}, \mathrm{B})$. Then $a x b, a y b \in \mathrm{I}$ for all $a \in \mathrm{~A}$ and $b \in \mathrm{~B}$. Then $a x b=s, a y b=t$ for some $s, t \in \mathrm{I}$. Then $s+t=a x b$ $+a y b=a(x+y) b \in \mathrm{I} \Rightarrow(x+y) \in(\mathrm{I}: \mathrm{A}, \mathrm{B})$. Let $p, q \in \mathrm{~T}$ and $x \in$ (I : A, B). $x \in(\mathrm{I}: \mathrm{A}, \mathrm{B}) \Rightarrow a x b \in \mathrm{I}$. Since I is a lateral POternary ideal of T . Hence $p(a x b) q \in \mathrm{I} \Rightarrow p a x b q=a p x q b \in \mathrm{I}$ $\Rightarrow p x q \in(\mathrm{I}: \mathrm{A}, \mathrm{B})$. Now, suppose that $p \in \mathrm{~T}$ and $x \in(\mathrm{I}: \mathrm{A}, \mathrm{B})$ such that $p \leq x . \quad x \in(\mathrm{I}: \mathrm{A}, \mathrm{B}) \Rightarrow a x b \in \mathrm{I} . p \leq x \Rightarrow a p b \leq a x b . a p b$ $\leq a x b$, I is a lateral PO-ternary ideal of T and hence $a p b \in \mathrm{I}$ $\Rightarrow p \in(\mathrm{I}: \mathrm{A}, \mathrm{B})$. Therefore $p \in \mathrm{~T}$ and $x \in(\mathrm{I}: \mathrm{A}, \mathrm{B})$ such that $p \leq$ $x \Rightarrow p \in(\mathrm{I}: \mathrm{A}, \mathrm{B})$. Hence ( $\mathrm{I}: \mathrm{A}, \mathrm{B}$ ) is a lateral PO-ternary ideal of T.

Theorem 3.12: Let $T$ be a PO-ternary semiring and I be a right PO-ternary ideal of T and A, B be a non-empty subset of T , Then $(\mathrm{I}: \mathrm{A}, \mathrm{B})=\{r \in \mathrm{~T}: a b r \in \mathrm{I}$, for all $a \in \mathrm{~A}, b \in \mathrm{~B}\}$ is a right PO-ternary ideal of T.

Proof: Let $x, y \in(\mathrm{I}: \mathrm{A}, \mathrm{B})$. Then $a b r, a b y \in \mathrm{I}$ for all $a \in \mathrm{~A}$ and $b \in \mathrm{~B}$. Then $a b x=s, a b y=t$ for some $s, t \in \mathrm{I}$. Then $s+t=a b x$ $+a b y=a b(x+y) \in \mathrm{I} \Rightarrow(x+y) \in(\mathrm{I}: \mathrm{A}, \mathrm{B})$. Let $p, q \in \mathrm{~T}$ and $x \in$ $(\mathrm{I}: \mathrm{A}, \mathrm{B}) . x \in(\mathrm{I}: \mathrm{A}, \mathrm{B}) \Rightarrow a b x \in \mathrm{I}$. Since I is a right PO-ternary ideal of T. Hence $(x a b) p q=a b(x p q) \in \mathrm{I} \Rightarrow x p q \in(\mathrm{I}: \mathrm{A}, \mathrm{B})$. Now, suppose that $p \in \mathrm{~T}$ and $x \in(\mathrm{I}: \mathrm{A}, \mathrm{B})$ such that $p \leq x, x \in$ ( $\mathrm{I}: \mathrm{A}, \mathrm{B}) \Rightarrow a b x \in \mathrm{I} . p \leq x \Rightarrow a b p \leq a b x . \quad a b p \leq a b x, \mathrm{I}$ is a right PO-ternary ideal of T and hence $a b p \in \mathrm{I} \Rightarrow p \in$ (I : A, B). Therefore $p \in \mathrm{~T}$ and $x \in(\mathrm{I}: \mathrm{A}, \mathrm{B})$ such that $p \leq x \Rightarrow p \in(\mathrm{I}: \mathrm{A}$, $B$ ). Hence ( $\mathrm{I}: \mathrm{A}, \mathrm{B}$ ) is a right PO-ternary ideal of T.

TheoreM3.13: Let T be a PO-ternary semiring and I be a POternary ideal of T and A, B be a non-empty subset of T, Then $(\mathrm{I}: \mathrm{A}, \mathrm{B})=\{r \in \mathrm{~T}: r a b, a r b, a b r \in \mathrm{I}$, for all $a \in \mathrm{~A}, b \in \mathrm{~B}\}$ is a PO-ternary ideal of T .

Proof: By theorems 3.10, 3.11, 3.12, it is easy to verify that (I: $\mathrm{A}, \mathrm{B}$ ) is a PO-ternary ideal of T .

Theorem3.14: Let T be PO-ternary semiring and I be a PO-kternary ideal of T and A be a non-empty subset of T , then ( I : $\mathrm{A}, \mathrm{B})=\{r \in \mathrm{~T}: r b a, r a b, a r b \in \mathrm{I}$, for all $a \in \mathrm{~A}, b \in \mathrm{~B}\}$ is a PO-$k$-ternary ideal of T .

Proof: By theorem 3.13, (I: A, B) is a PO-ternary ideal of T. Let $r \in(\mathrm{I}: \mathrm{A}, \mathrm{B}), y \in \mathrm{~T}$ such that $r+y \in(\mathrm{I}: \mathrm{A}, \mathrm{B})$ then $r b a, a r b$, $a b r \in \mathrm{I}$, and $(r+y) b a, a b(r+y), a(r+y) b \in \mathrm{I}$ for all $a \in \mathrm{~A}, b \in$ B. Then $r b a+y b a=(r+y) b a \in$ I which is PO- $k$-ternary ideal. Hence $y b a \in$ I.similarly, $a b t \in \mathrm{I}$ and $a b y \in \mathrm{I}$. Therefore $y \in$ (I: A, B). Hence (I : A, B) is a PO-k-ternary ideal of T.

Definition3.15: A PO-ternary semiring T is said to be $\boldsymbol{E}$ inverse, provided for every $a \in \mathrm{~T}$, there exist $x \in \mathrm{~T}$ such that $a$ $+x \in \mathrm{E}^{+}(\mathrm{T})$.

Note 3.16: In a PO-ternary semiring $T$ the set of all additive idempotents $\mathrm{E}^{+}(\mathrm{T})$ is not a PO- $k$-ternary ideal.

Example3.17: Let $\mathrm{T}=\{0, a, b\}$ such that $0 \leq a \leq b$ and define the addition, ternary multiplication on T as

Then T is a additive inverse PO-ternary semiring under the operations. Moreover $\mathrm{E}^{+}(\mathrm{T})=\{0, b\}$ is a PO-ternary ideal of T. But $a+b=b \in \mathrm{E}^{+}(\mathrm{T})$ and $a \notin \mathrm{E}^{+}(\mathrm{T})$ and hence $\mathrm{E}^{+}(\mathrm{T})$ is not PO-k-ternary ideal.

Note3.18: The sum of two PO-k-ternary ideals need not be a PO-k-ternary ideal.

Example3.19: Consider the PO-ternary semiring of positive integers with zero $Z_{0}^{+}$under the usual addition and ternary multiplication. Then $2 Z_{0}^{+}$and $3 Z_{0}^{+}$are PO-k-ternary ideals of $Z_{0}^{+}$. But $2 Z_{0}^{+}+3 Z_{0}^{+}=Z_{0}^{+} \backslash\{1\}$ is not a PO-k-ternary ideal. Indeed $1+2=3$, where $2,3 \in 2 Z_{0}^{+}+3 Z_{0}^{+}$, but $1 \notin 2$ $Z_{0}^{+}+3 Z_{0}^{+}$.

Theorem3.20: Let T be a PO-ternary semiring. If A is a POternary ideal of T such that $\mathrm{A}=\mathrm{I} \cup \mathrm{J}$, where $\mathrm{I}, \mathrm{J}$ are PO- $k$ ternary ideals, then $\mathrm{A}=\mathrm{I}$ or $\mathrm{A}=\mathrm{J}$.

Proof: Since A $=I U J$, then $I \subseteq$ Aand $\mathrm{J} \subseteq \mathrm{A}$. Now suppose A $\neq \mathrm{I}$, and $\mathrm{A} \neq \mathrm{J}$, then there exist $x, y \in$ Asuch that $x \in \mathrm{I}, x \notin \mathrm{~J}, y \in \mathrm{~J}$, $y \notin \mathrm{I}$, but $x+y \in \mathrm{~A}=\mathrm{I} \mathrm{UJ}$, so $x+y \in \operatorname{Ior} x+y \in \mathrm{~J}$, now if $x+y$ $\in \mathrm{I}$, then $y \in$ Ias Iis PO- $k$-ternary ideal, contradiction. Also if $x+y \in \mathrm{~J}$ then $x \in \mathrm{Jas}$ Jis PO- $k$-ternary ideal, contradiction. Hence $\mathrm{A}=\mathrm{I}$ or $\mathrm{A}=\mathrm{J}$.

## Full Po-K-Ternary ideals

In this section, we will study more restrictions on the po- $k$ ternary ideal and the PO-ternary semiring. We study full PO-$k$-ternary ideal in additive inversive ternary semirings, so $T$ denotes an additive inversive ternary semiring.

Definition4.1: A PO-ternary semiring T is said to be additively regular if for each $a \in \mathrm{~T}$, there exists an element $a^{\#}$ $\in T$ such that $a=a+a^{\#}+a$.

Theorem4.2: Let T be a PO-ternary semiring and if $a$ is an additively regular element of T. Then the element $a^{\#}$ is unique.

Proof: Assume that $b, c$ are element of T such that $a+b+a=$ $a=a+c+a, b+a+b=b$ and $c+a+c=c$. Then $b=b+a+$ $b=b+a+c+a+b=b+a+b+a+c=b+a+c$ $=c+b+a=c+c+b+a+a=c+c+a+b+a=c+c+a=$ $c+a+c=c$. Therefore $b=c=a^{\#}$.

Definition4.3: A PO-ternary semi ring T is said to be additively inverse PO-ternary semi ring if for each $a \in \mathrm{~T}$, there exists a unique element $b \in \mathrm{~T}$ such that $a=a+b+a$ and $b=b$ $+a+b$.

Note4.4: In an additively inverse PO-ternary semi ring the unique inverse $b$ of an element $a$ is usually denoted by $a^{\prime}$.

Definition4.5: A PO-k-ternary ideal A of a PO-ternary semi ring T is said to be a full $P O$-k-ternary ideal provided the set of all additive idempotent of $\mathrm{T}, \mathrm{E}^{+}(\mathrm{T})$ contained in A .

Example 4.6: In any PO-ternary ring R every ideal A is a full PO-k-ternary ideal. Since 0 is the only additive idempotent element in R which belongs to any PO-ternary ideal A of R. So A is full PO-k-ternary ideal.

Example4.7: In $\mathrm{Z} \times \mathrm{Z}^{+}=\{(a, b): a, b$ are integers $b>0\}$, define $(a, b)+(c, d)=(a+c, l c m(b, d)),[(a, b)(c, d)(e, f)]=$ (ace, gcd $(b, d, f)$ ) and $(a, b) \leq(c, d)$ if $a \leq c$ and $b \leq d$. Then Z $\times \mathrm{Z}^{+}$is an additive inverse PO-ternary semiring, since for any $(a, b),(c, d),(e, f) \in \mathrm{Z} \times \mathrm{Z}^{+}$

## Additive Commutative

$(a, b)+(c, d)=(a+c, l c m(b, d))=(c+a, l c m(d, b))=(c, d)$ $+(a, b)$.

## Additive Associative

$((a, b)+(c, d))+(e, f)=((a+c, \operatorname{lcm}(b, d))+(e, f)$ $=(((a+c)+e, \operatorname{lcm}(\operatorname{lcm}(b, d), f))$ $=((a+(c+e)$, lcm $(b$, lcm $(d, f)))$

$$
=(a, b)+((c+e), \operatorname{lcm}(d, f))
$$

$$
=(a, b)+((c, d)+(e, f))
$$

Multiplicative associative: Similarly as additive associative

## Distributive

$(a, b) \cdot(c, d) \cdot((e, f))+(g, h))=(a, b) \cdot(c, d) \cdot((e+g, \operatorname{lcm}(f, h))$

$$
\begin{aligned}
&=(a, b) \cdot(c \cdot(e+g), \operatorname{gcd}(d, l c m(f, h))) \\
&=(\operatorname{a.c} \cdot(e+g), \operatorname{gcd}(b, \operatorname{gcd}(d, l c m(f, h)))) \\
&=(a, b) \cdot(c, d) \cdot(e, f)+(a, b) \cdot(c, d) \cdot(g, h) .
\end{aligned}
$$

Similarly $(a, b) \cdot((e, f))+(g, h)) \cdot(c, d)=(a, b) \cdot(e, f) \cdot(c, d)+(a$, $b) \cdot(g, h) \cdot(c, d)$ and $((e, f))+(g, h)) \cdot(a, b) \cdot(c, d)=(e, f) \cdot(a, b) \cdot(c$, $d)+(g, h) \cdot(a, b) \cdot(c, d)$.

Additive inverse: For any $(a, b) \in \mathrm{Z} \times \mathrm{Z}^{+}$, there exist a unique $(-a, b) \in \mathrm{Z} \times \mathrm{Z}^{+}$such that
$(a, b)+(-a, b)+(a, b)=(a+-a+a, l c m(b, b, b))=(a, b)$, $(-a, b)+(a, b)+(-a, b)=(-a+a+-a, l c m(b, b, b))=(-a$, $b)$.
Moreover, the set $A=\left\{(a, b) \in Z \times Z^{+}: a=0, b \in Z^{+}\right\}$is a full PO- $k$-ternary ideal of $Z \times Z^{+}$. Since $\mathrm{E}^{+}\left(\mathrm{Z} \times \mathrm{Z}^{+}\right)=\{0\} \times \mathrm{Z}^{+} \subseteq$ A , and for any $(0, b) \in \mathrm{A},(c, d) \in \mathrm{Z} \times \mathrm{Z}^{+}$such that $(0, b)+(c, d)=(c, \operatorname{lcm}(b, d)) \in A$, then $c=0$, and hence $(c, d)$ $\in \mathrm{A}$.

Theorem4.8: The intersection of two full PO- $k$-ternary ideals of a PO-ternary semiring T is a full PO-k-ternary ideal of T.

Proof: Let A, B be two full PO-k-ternary ideals of T. Then by theorem 3.5.7, $\mathrm{A} \cap \mathrm{B}$ is a PO-ternary ideal of T which is full as $\mathrm{E}^{+}(\mathrm{T}) \subseteq \mathrm{A}$ and $\mathrm{E}^{+}(\mathrm{T}) \subseteq \mathrm{B}$. Now, let $t \in \mathrm{~T}$ such that $a+t \in \mathrm{~A} \cap \mathrm{~B}$ for some $a \in \mathrm{~A} \cap \mathrm{~B}$, then $a+t \in \mathrm{~A} \cap \mathrm{~B}, a \in \mathrm{~A}$ and $a+t \in \mathrm{~A} \cap \mathrm{~B}, a \in \mathrm{~B}$, then $t \in \mathrm{~A}, t \in \mathrm{~B}$ as $\mathrm{A}, \mathrm{B}$ be PO- $k$ ternary ideals. Therefore $t \in \mathrm{~A} \cap \mathrm{~B}$.

Theorem4.9: Every PO-k-ternary ideal of a PO-ternary semiring T is an inversive PO-ternary subsemiring of T .

Proof: Obviously that every PO-ternary ideal of T is POternary subsemiring of T. Let $a \in \mathrm{~A}$, then $a \in \mathrm{~T}$. Therefore there exist an $a^{\prime} \in \mathrm{T}$ such that $a=a+a^{\prime}+a=a+\left(a^{\prime}+a\right) \in$ A. But A is PO-k-ternary ideal and $a \in \mathrm{~A}$, so $a+a^{\prime} \in \mathrm{A}$. Again A is PO-k-ternary ideal and $a \in \mathrm{~A}$, so $a^{\prime} \in \mathrm{A}$. Therefore A is an inverse PO-ternary subsemiring of T .

Definition4.10: Let A be a PO-ternary ideal of an additive inversive PO-ternary semiring T. We define $k$-closure of A, denoted by $\bar{A}$ by:

$$
\bar{A}=\{a \in \mathrm{~T}: a+x \in \mathrm{~A} \text { for some } x \in \mathrm{~A}\} .
$$

Theorem4.11: Let T be a PO-ternary semiring and A be a POternary ideal of T , then $\bar{A}$ is a PO-k-ternary ideal of T . Moreover $\mathrm{A} \subseteq \bar{A}$ and $(\mathrm{A}] \subseteq(\bar{A}]$.

Proof: Let $a, b \in \bar{A}$, then $a+x, b+y \in \mathrm{~A}$ for some $x, y \in \mathrm{~A}$. Now $(a+b)+(x+y)=(a+x)+(b+y) \in$ A. But $x+y \in \mathrm{~A}$ and hence $a+b \in \bar{A}$.

Next $s, t \in \mathrm{~T}$, then $s t a+s t x=s t(a+x) \in \mathrm{A}$. But $s t x \in \mathrm{~A}$, therefore $\operatorname{sta} \bar{A}$. Similarly sat and ast $\bar{A}$. Hence $\bar{A}$ is a ternary ideal of T. Now let $a \in \bar{A}$ and $t \in \mathrm{~T}$ such that $t \leq a . a \in$ $\bar{A} \Rightarrow a+x \in \mathrm{~A}$ for some $x \in \mathrm{~A}$. Since A is PO-ternary ideal of T , so $t \leq a \Rightarrow t+x \leq a+x$. Since $a+x \in \mathrm{~A} \Rightarrow t+x \in \mathrm{~A} \Rightarrow t \in \bar{A}$
and hence $\bar{A}$ is a PO-ternary ideal of T . To show that $\bar{A}$ is a PO- $k$-ternary ideal, let $c, c+d \in \bar{A}$, then there exist $x$ and $y$ in A such that $c+x \in \mathrm{~A}$ and $c+d+y \in \mathrm{~A}$. Now $d+(c+x+y)=$ $(c+d+y)+x \in \mathrm{~A} \Rightarrow c+d+y \in \mathrm{~A}$. Hence $d \in \bar{A}$. Therefore $\bar{A}$ is a PO- $k$-ternary ideal. Finally, since $a+a \in \mathrm{~A}$ for all $a \in \mathrm{~A}$, it follows that $\mathrm{A} \subseteq \bar{A}$. By theorem 2.7, (A] $\subseteq(\bar{A}]$.

Lemma4.12: Let T be a PO-ternary semiring and A be a POternary ideal of T. Then $\mathrm{A}=\bar{A}$ if and only if A is a PO-kternary ideal of T .
Proof: Suppose that $\mathrm{A}=\bar{A}$, then by theorem 4.11, $\bar{A}$ is a PO- $k$-ideal of T, and hence A is PO- $k$-ideal of T. Conversely, suppose that A is a PO- $k$-ternary ideal of T. Again by theorem 4.11, A $\subseteq \bar{A}$. On the other hand, let $a \in \bar{A}$ then $a+x \in \mathrm{~A}$ for some $x \in \mathrm{~A}$. But A is a PO-k-ternary ideal of T and $x \in \mathrm{~A}$ implies that $a \in \mathrm{~A}$. There fore $\bar{A} \subseteq \mathrm{~A}$. Hence $\mathrm{A}=\bar{A}$.

Lemma4.13: Let T be a PO-ternary semiring and A, B be two PO-ternary ideals of T such that $\mathrm{A} \subseteq \mathrm{B}$, then $\bar{A} \subseteq \bar{B}$.

Proof : Let A, B be two PO-ternary ideals of T such that $\mathrm{A} \subseteq$ B , let $a \in \bar{A}$, then $a+x \in \mathrm{~A}$ for some $x \in \mathrm{~A}$, but $\mathrm{A} \subseteq \mathrm{B}$ and hence $a+x \in \mathrm{~B}$ for some $x \in \mathrm{~B}$, therefore $a \in \bar{B}$. Hence $\bar{A} \subseteq \bar{B}$.

Lemma4.14: Let T be a PO-ternary semiring and A be a POternary ideal of T. Then $\bar{A}$ is the smallest PO-k-ternary ideal of T containing A.

Proof: Let B be a PO-k-ternary ideal of T such that $\mathrm{A} \subseteq \mathrm{B}$, let $x \in \bar{A}$. Then $x+a=b$ for some $a, b \in \mathrm{~A}$. Since $\mathrm{A} \subseteq \mathrm{B}$ and B is a PO- $k$-ternary ideal of T, then $x \in \mathrm{~B}$. There fore $\bar{A} \subseteq \mathrm{~B}$.

Lemma4.15: Let T be a PO-ternary semiring and A, B be two full PO- $k$-ternary ideals of T , then $\overline{A+B}$ is a full PO- $k$-ideal of T such that $\mathrm{A} \subseteq \overline{A+B}$ and $\mathrm{B} \subseteq \overline{A+B}$.

Proof: By theorem 2.9, A + B is a PO-ternary ideal of T. then by theorem $4.11, \overline{A+B}$ is a PO- $k$-ternary ideal of T and $\mathrm{A}+\mathrm{B}$
$\subseteq \overline{A+B}$. Now $\mathrm{E}^{+}(\mathrm{T}) \subseteq \mathrm{A}$ and $\mathrm{E}^{+}(\mathrm{T}) \subseteq \mathrm{B}$. so far any $e \in$ $\mathrm{E}^{+}(\mathrm{T}), e+e=e$. Therefore $\mathrm{E}^{+}(\mathrm{T}) \subseteq \mathrm{A}+\mathrm{B} \subseteq \overline{A+B}$. This implies that $\overline{A+B}$ is a full PO-k-ternary ideal of T. Finally, let $a \in \mathrm{~A}$, then $a=a+a^{\prime}+a=a+\left(a^{\prime}+a\right) \in \mathrm{A}+\mathrm{B}$ as $\left(a^{\prime}+\right.$ $a) \in \mathrm{E}^{+}(\mathrm{T}) \subseteq \mathrm{B}$. Hence $\mathrm{A} \subseteq \overline{A+B}$. Similarly $\mathrm{B} \subseteq \overline{A+B}$.

## Conclusion

In this paper mainly we studied about po-k-ternary ideals and full po- $k$-ternary ideals in PO-ternary semiring.
